

# Slush Machine Instructions

## **Electrical:**

Machine requires 20 amp outlet and must be plugged directly into wall. No extension cords!

## **Mixing of Flavors:**

Slush mix is a ratio of 4:1. (four parts water to one part of slush mix). It is very important to make your measurements correctly.

The machine holds about 2.5 gallons of slush mix per side.

## **Using the Machine:**

1. Pour slush flavors in the clear basins.
2. Turn on the main power.
3. Turn on the augers and the freezer (looks like a circular arrow and a snow flake).

Please allow 1-2 hours for the slush mix to freeze. The time for freezing is dependent on where you place the machine. If you are in a cool, dry area it will take less time to freeze. If you are in a hot, humid area it will take longer to freeze.

Never place machine in direct sunlight.

## **Cleaning of the Machine:**

Drain unused slush mix. Rinse the inside holding area with clean water and drain again. Do not take machine apart to clean as we will thoroughly clean when returned.

Do not spray base of the machine as this could damage electrical components!
